ORGANIZATION OF BULLETIN No. 130 SERIES

- Volume I - NORTH COASTAL AREA
- Volume II - NORTHEASTERN CALIFORNIA
- Volume III - CENTRAL COASTAL AREA
- Volume IV - SAN JOAQUIN VALLEY
- Volume V - SOUTHERN CALIFORNIA

Each volume consists of the following:

TEXT and

- Appendix A - CLIMATE
- Appendix B - SURFACE WATER FLOW
- Appendix C - GROUND WATER MEASUREMENTS
- Appendix D - SURFACE WATER QUALITY
- Appendix E - GROUND WATER QUALITY

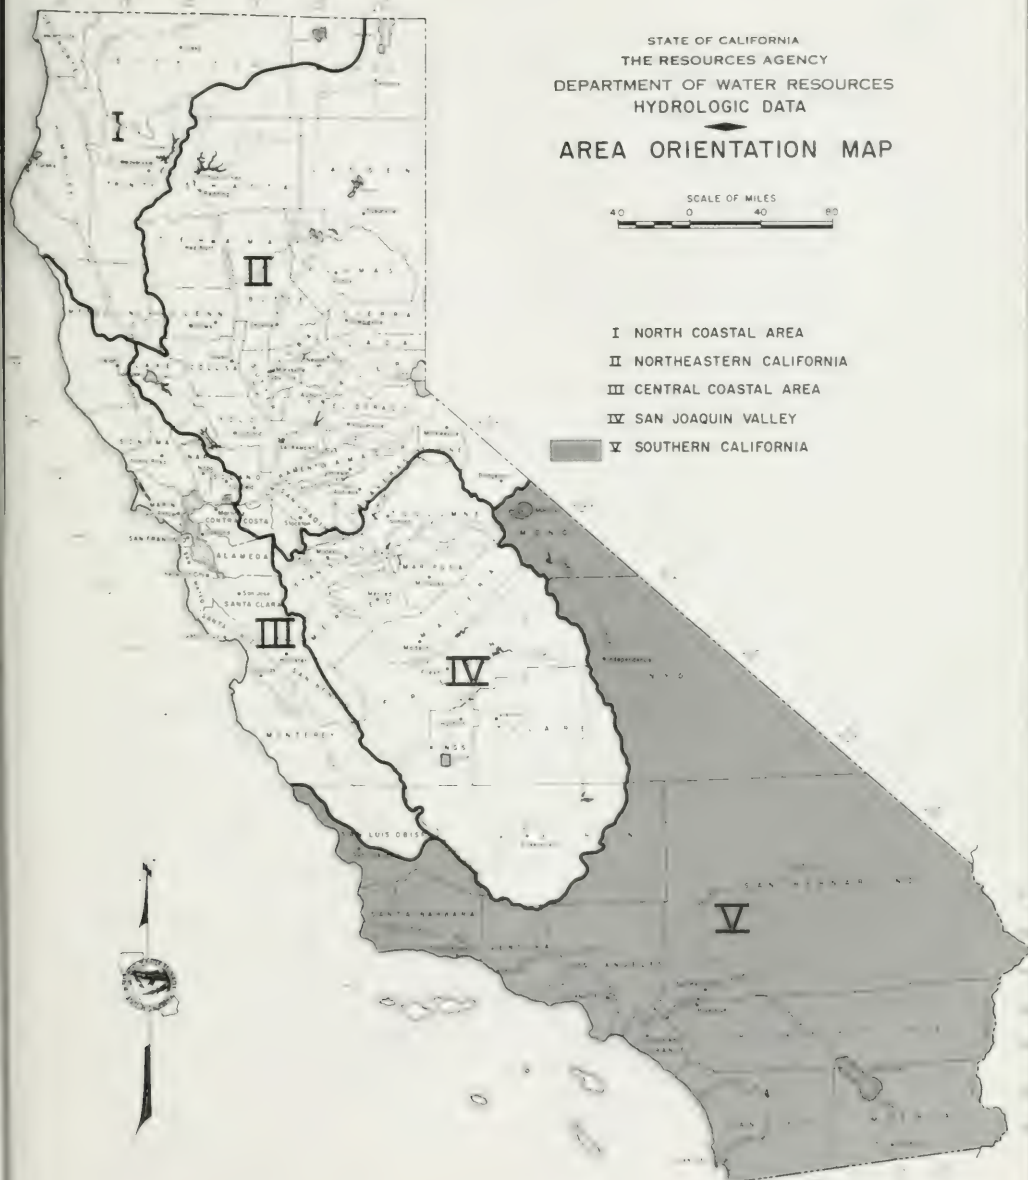

STATE OF CALIFORNIA

## INTRODUCTION

This cover contains tabulations of ground water measurements made in the Southern District during the period July 1, 1962 to June 30, 1963, for the Central Coastal and Los Angeles Drainage Provinces. The area within the Southern District is shown on Figure 1. A separate cover contains measurements for the Lahontan, Colorado River Basin, Santa Ana, and San Diego Drainage Provinces. The tabulations show the State Well Number, ground surface elevation, date of measurement, distance from ground surface to water surface, water surface elevation, and the agency supplying the data. The data are tabulated by hydrologic areas.

To facilitate machine processing of hydrologic data published in this report, numeric and alphabetic codes were adopted to designate hydrologic areas, wells, agencies, and other pertinent notes. These codes are described in the following paragraphs.

### Hydrologic Area Coding System

Bulletin 130-63, Volume V, introduces a new coding system based primarily on drainage boundaries. This system supersedes the previously used areal designation code based on ground water basins. Briefly, the new areal designation code identifies a hydrologic area by a system of five characters in the form A-11.A1, consisting of two alphabetic characters and three numeric characters. The alphabetic character to the left of the dash refers to the drainage province, as shown on the key map inset on each of the six plates which appear at the end of each cover. The two numeric characters to the left of the decimal point refer to the hydrologic unit, and the one alphabetic character and the one numeric

character to the right of the decimal point refer to the hydrologic subunit and hydrologic subarea, respectively. When a hydrologic subunit is not divided into hydrologic subareas, the character to the far right is a numeric zero. When a hydrologic unit is not divided into hydrologic subunits, both of the characters to the right of the decimal are numeric zeros. A complete description and a discussion of the new coding system will be found in the text of this report, published as a separate cover.

On each of the plates following the respective appendixes is a tabulation of the names and numbers of the hydrologic areas for the drainage province involved. The table of contents of each of the appendixes lists the data by hydrologic areas.

#### Well Numbering System

The state well numbering system used in this report is based on township, range, and section subdivision of the Public Land Survey. It is the system used in all ground water investigations and for numbering all wells for which data are published or filed by the Department of Water Resources. In this report the number of a well, assigned in accordance with this system, is referred to as the State Well Number.

Under the system, each section is divided into 40-acre tracts lettered as follows:

D	C	B	A
E	F	G	H
M	L	K	J
N	P	Q	R

Note that I and O are omitted in the grid above.

Wells are numbered within each 40-acre tract according to the chronological sequence in which they have been assigned State Well Numbers. For example, a well which has the number 16N/3E-17K1, M, would be in Township 16 North, Range 3 East, Section 17, Mount Diablo Base and Meridian, and would be further designated as the first well assigned a State Well Number in tract K. Well numbers are referenced to the Mount Diablo Base and Meridian (M), or the San Bernardino Base and Meridian (S).

#### Ground Surface Elevations

The ground surface elevations for the majority of the wells for which data are given in this report were obtained by measurement, usually by engineer's level. However, in those instances when a direct measurement is not available, the ground surface elevation was estimated from topographic maps. Estimated elevations are indicated by a double asterisk immediately following the value.

This report marks a revision from the practice of prior years, when depths to water were given as the distance from a reference point to water surface. This revision was made in the interest of uniformity of data reporting among various agencies.

#### Flowing or Dry Well

In the tabulations of ground water levels at wells in this volume, the code words "FLOW" and "DRY" are used in some instances in the column "Dist. G. S. to Water Surface, in feet". The word "FLOW" connotes an observation where water was freely flowing over the top of the casing because the piezometric elevation at the well was greater than the elevation of the top of the casing. The word "DRY" is used when no

standing water was observed in the well because the depth to ground water was equal to or greater than the depth of the well.

#### Qualified or Questionable Measurements

Unless otherwise indicated, the measurements given are of static water levels. Values in the column "Dist. G. S. to Water Surface" in this cover may be followed with an alphabetic character or asterisk, which indicates a qualified or questionable measurement. "P" indicates that the well was being pumped at the time of measurement. "A" indicated that the measurement was made by air gage. An asterisk indicates that a nearby pump was operating, the casing was leaking or wet, the well was pumped recently, or the measurement was determined to be questionable by the computer. The computer was programmed to "flag" all measurements for which the change in elevation was in excess of two feet per week, an arbitrary value used to indicate that the change may be unreasonable. This "reasonableness check" was installed primarily to find errors in transcription and to point out possible measurements effected by pumping but not so qualified. Measurements indicated to be unreasonable were reviewed and, where possible, errors resulting from incorrect transcription removed. The reason for an asterisk following any given measurement may be obtained from the Southern District of the Department of Water Resources.

#### Agency Code

The agency code used in this report for ground water measurements consists of four numeric characters for indicating the agency supplying the data. The complete agency code number, which is not used

in this report, requires a fifth character to indicate the drainage province. The code number for a given agency will not necessarily be the same in different drainage provinces and, conversely, a different number in different drainage provinces will not necessarily indicate different agencies.

The left digit of the four indicates the well numbering system used by the agency, as follows:

1. The location numbering system originated by the Los Angeles County Flood Control District, based on 6-minute quadrangle maps.
2. The Ventura County Flood Control District numbering system.
3. The State Serial Number system originally used in the Bulletin 39 series.
4. Local agency numbering system.
5. Official State Well Numbering system.

The right three digits indicate the type of agency according to the following system:

000 to 049	Federal Agencies
050 to 099	State Agencies
100 to 199	County Agencies
200 to 399	Municipalities
400 to 699	District - Water, Irrigation, etc.
700 to 999	Private Agencies

The agency code for each of the drainage provinces is presented in this appendix following the tables of ground water level data for each province.
